Since the atomic hydrogen can be eliminated from the vinyl moiety and/or the aromatic ring of the styrene, the reactions of carbon with D3- and D5-styrene were performed to trace the source. Signal was probed at m/z 118 ($\text{C}_9\text{H}_4\text{D}_3^+$) and 117 ($\text{C}_9\text{H}_3\text{D}_3^+/\text{C}_9\text{H}_5\text{D}_2^+$) in the C-C₆H₅C₂D₃ reaction (reaction S1) with the determined ratio of 0.89 ± 0.03 : 1 of 118 to 117 taking into consideration of the ¹³C isotopic contribution and the difference of the recoil circles related to atomic hydrogen and deuterium loss. For the C-C₆D₅C₂H₃ system (reaction S2) the ratio of 0.74 ± 0.03 (120):1 (119) is calculated according to the same procedure. Meanwhile, the experimentally derived ratio of 118: 120 is measured to be 1.18 ± 0.02 : 1 under the same experimental conditions of the secondary beam (pressure, pulse voltage, etc) and calibrated according to the intensity of the primary atomic carbon beam. Considering the four pathways i) $\text{i2} \rightarrow \text{p3} + \text{H}$, ii) $\text{i2} \rightarrow \text{p2} + \text{H}$, iii) $\text{i6} \rightarrow \text{p2} + \text{H}$, and iv) $\text{i7} \rightarrow \text{p1} + \text{H}$ along with the RRKM-predicted ratios of 1-indenyl (iv: 54.7 %), 1-phenylpropargyl (ii: 29.5 %; iii: 12.1 %), and 3-phenylpropargyl (i: 3.5 %), the C/C₆H₅C₂D₃ system (fig. S4) predicts that the signal from the atomic hydrogen loss (m/z 118, reaction S1) contribute 54.7 % since only pathway iv leads to the H elimination in this system. In the same procedure, the contribution from H loss in the C/C₆D₅C₂H₃ system (m/z 120, reaction S2, fig. S5) is confirmed to be 45.1 % as the sum of pathway i-iii. Thus the RRKM- predicted ratio of 118 (H loss signal of C/C₆H₅C₂D₃): 120 (H loss signal of C/C₆D₅C₂H₃) should be 0.55 ± 0.01 : 0.45, i.e., 1.22 ± 0.03 : 1 under the same intensity of primary and secondary beam in the two systems. This ratio still holds with the existence of the fragmentation since the fragment ratio of 118 to 117 in C/C₆H₅C₂D₃ system is also nearly the same compared to that of 120 to 119 in C/C₆D₅C₂H₃ system. It should be noted that the dicarbon (C₂) and tricarbon (C₃) were also produced in the ablation source at minor levels of less than a few per cent. However, no signal from reactions of dicarbon or tricarbon was observed. Most important, signal recorded at m/z 115 can only be replicated with a single channel via reaction of atomic carbon with styrene.

The rate constants of the reactions included in the modeling are derived from the published results. For example, the rate constant for the reaction of atomic carbon with styrene is predicted according to the reaction of atomic carbon with stem compound ethylene which proceeds rapidly with the rate constant of $2 \times 10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ (45). As for the C₃H₃-C₆H₅ reaction, the rate constant is predicted to be a few $10^{-10} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ under our experimental conditions (41).

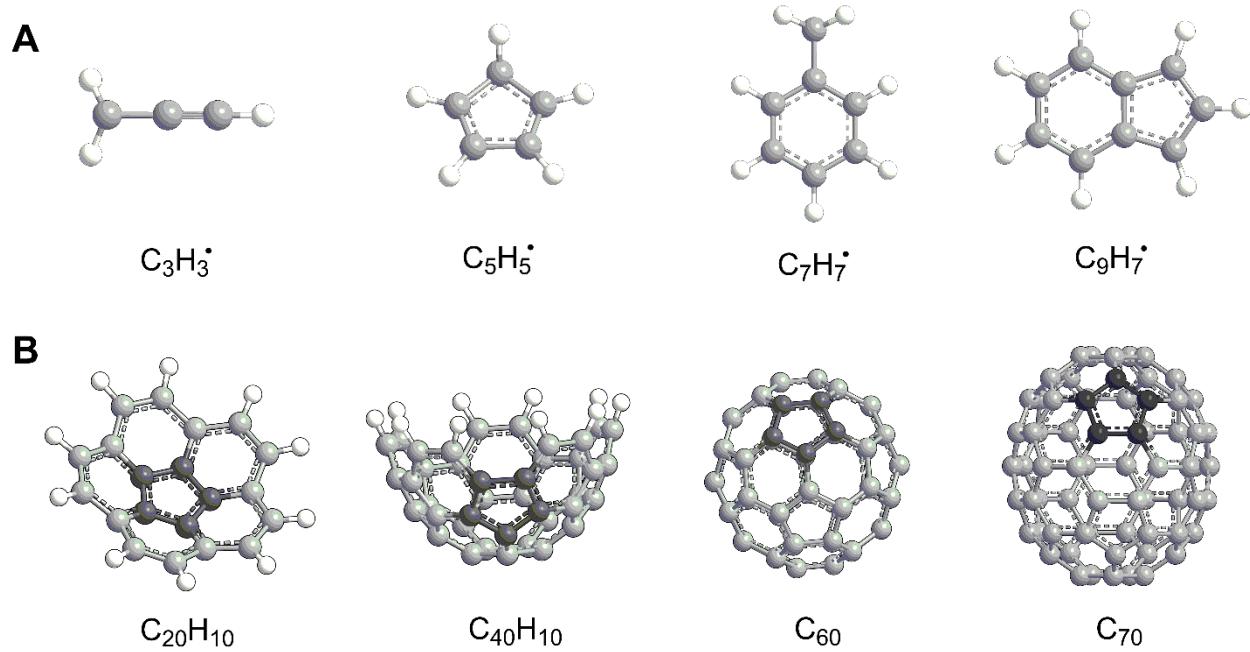

Fig. S1. Molecular structures of the selected molecules. Resonantly stabilized free radicals (RSFRs) (A) and corannulene ($C_{20}H_{10}$), the C_{40} nanobowl ($C_{40}H_{10}$), buckminsterfullerene (C_{60}), and rugbyballene (C_{70}) (B). Propargyl (X^2B_2), cyclopentadienyl ($X^2E_1^-$), benzyl (X^2B_2), and 1-indenyl (X^2A_2) are key precursors to PAHs in both high-temperature and low-temperature molecular mass growth processes. Carbon and hydrogen are color-coded in gray and white, respectively. The carbon atoms of the five-membered ring are highlighted in black in (B).

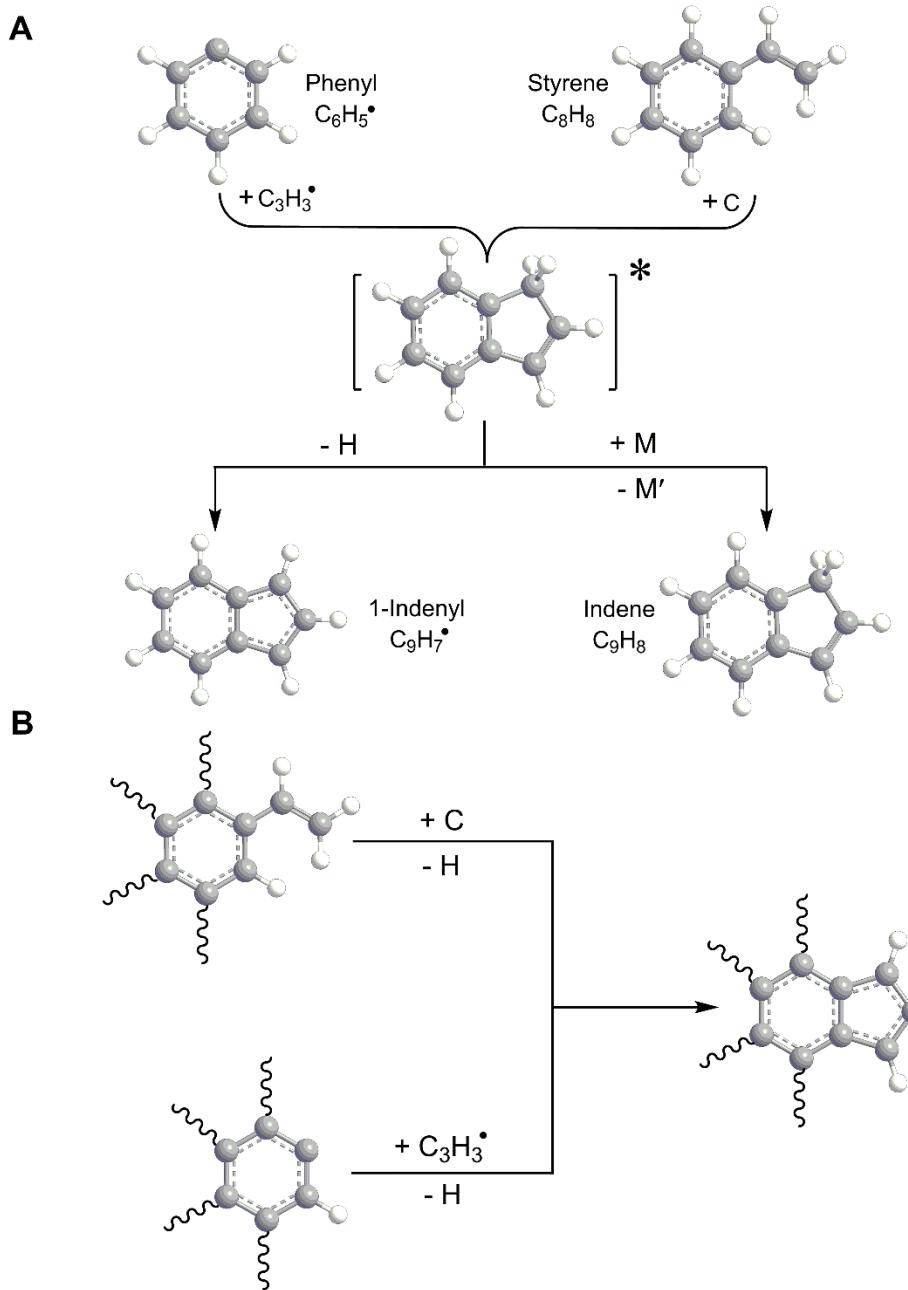

Fig. S2. Pathways to 1-indenyl and indene. Reactions of atomic carbon with styrene and propargyl with phenyl (A) and reactions involving more complex vinyl substituted or aryl radical reactants (B). Pathway to 1-indenyl ($C_9H_7^\bullet$) is opened under low-temperature single collision conditions while indene (C_9H_8) is formed at elevated pressures facilitating a three-body stabilization process within hydrocarbon-rich atmospheres like in Titan's atmosphere. The lower panel displays the broader impacts of our findings on molecular mass growth processes with the waved lines indicating the incorporation within a PAH (B).

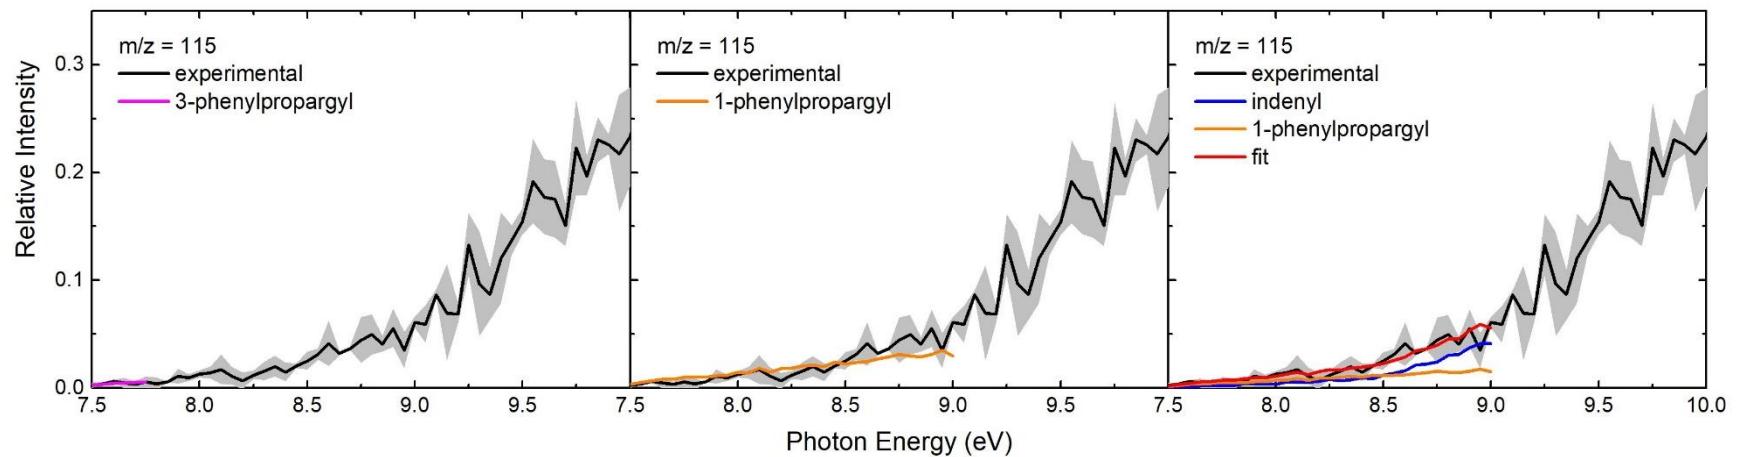

Fig. S3. The comparison of available experimental PIE of 1-phenylpropargyl (C_6H_5CHCCH) and 3-phenylpropargyl ($C_6H_5CCCH_2$) radicals with our experimental PIE curve of $m/z = 115$ along with the fitting of the PIE curve at 115 with the sum of two channels: indenyl and 1-phenylpropargyl in the photon energy range of 7.5 to 9.0 eV. Experimental PIE is collected from 7.5 to 10 eV while PIE of 1-phenylpropargyl and 3-phenylpropargyl are collected in a very short range 7.5 – 9.0 and 7.5 – 7.8 eV, respectively. More PIE data of reference radicals are needed to accurately calculate the branching ratios of the ion counts at 115.
