Tentative assignments of C₂H₄O₃ and C₃H₆O₃ isomers

The TPD profile of the ion signal at $m/z = 76$ for the irradiated CO₂–HOCH₂CH₂OH ice at 11.10 eV (fig. S7A) shows a broad sublimation event from 175 K to 320 K. The replacement of the CO₂–HOCH₂CH₂OH ice by ¹³CO₂–HO¹³CH₂¹³CH₂OH ice shifts the m/z by 2 amu from $m/z = 76$ to 78, indicating the presence of two carbon atoms. Therefore, the sublimation event peaking at 259 K can be clearly linked to a molecule of the formula C₂H₄O₃. Furthermore, the shift by 4 amu from $m/z = 76$ (C₂H₄O₃⁺) to 80 in the C¹⁸O₂–HOCH₂CH₂OH ice indicates the presence of two oxygen atoms and that one carbon dioxide participates in the formation of C₂H₄O₃ products. When lowering the photon energy to 8.77 eV, this sublimation event is absent (fig. S7B). Previous laboratory experiments revealed the formation of glycolic acid (**9**, IE = 10.00 – 10.54 eV) in irradiated carbon dioxide – methanol (**10**) ice with a sublimation event from 180 K to 310 K and a peak at 251 K (12). This result matches well with our TPD profile at $m/z = 76$, suggesting that the peak at 259 K in the irradiated CO₂–HOCH₂CH₂OH ice is likely associated with glycolic acid (**9**). Additionally, the TPD profile at $m/z = 90$ in the irradiated CO₂–HOCH₂CH₂OH ice at 11.10 eV shows a broad sublimation event after 180 K (fig. S8A). This TPD profile shifts the m/z by 3 amu from $m/z = 90$ to 93 in ¹³CO₂–HO¹³CH₂¹³CH₂OH ice and by 2 amu from $m/z = 90$ to 92 in C¹⁸O₂–HOCH₂CH₂OH ice, indicating the presence of three carbon atoms and at least one oxygen atom, respectively; hence, this sublimation event can be linked to a molecule of the formula C₃H₆O₃. Upon reducing the photon energy to 8.77 eV, a narrow peak from 205 K – 245 K remains and the high-temperature range (245 K – 320 K) of the TPD profile vanishes (fig. S8B). This absent sublimation event is linked to the C₃H₆O₃ isomers that have IEs between 8.77 eV and 11.10 eV and may be caused by glyceraldehyde (**5**, IE = 9.23 – 9.91 eV), 3-hydroxypropionic acid (**12**, IE = 9.11 – 10.50 eV) and/or lactic acid (**13**, IE = 9.82 – 10.18 eV) (Fig. 1). The remaining sublimation event at 8.77 eV can be correlated with other C₃H₆O₃ isomers.
